Nigel Qualter Plumbing can supply and fit a range of boilers including condensing boilers, combination boilers and system boilers. Our trained staff are available 24/7 for any questions you may have and are able to give free estimate and quotes for boiler installations. New boilers are now much safer and more energy efficient than ever, so choosing to have a new boiler installed will help you save money in the long term. There are several types of boiler from which you can choose, so it's important that you understand how they differ if you're to make the right choice for your individual needs. Gas is the most used fuel for heating the home, although oil and electric systems are also available.

The size of your boiler is dictated by the output you require. This is measured in terms of radiators and hot water cylinders. It has been common in the past to oversize boilers to make sure the boiler would heat your house adequately. One result of this is that most boilers installed pre 1989 are as much as 30% oversized. This is an incredible drain on finance as well as energy and these days boiler efficiency calculations are much more advanced.

Oil Boiler Installation

Nigel Qualter Plumbing provide a quality supply and installation service for oil boilers and central heating systems. Oil is one of the cheapest, most environmentally friendly fuels and many homes in our county safely use oil as opposed to gas or electric. Modern clean burning oil boilers have low CO2 emissions and high efficiency ratings. Over the last 10 years, oil has consistently been the cheapest central heating option.
